	<p>boundary, the distance is ascertained as 30 meters. It may kindly be noted that the effect on the surface structures, due to underground mining operations is primarily due to subsidence factors only. While designing the mining operational limits the angle of draw has been taken into consideration. The zone is defined with an angle of 370 from the center of the deepest level. This center is falling at a distance of 55 meters from the western boundary. The village thus falls at a distance of 85 meters from the center of the western deposit where the calculation of angle of draw is taken into consideration. The angle mentioned above when drawn for the angle of draw, ends at point PBH-5. From this point the habitat boundary is still 37.5 meters. Thus the mining subsidence if any will not affect the village in any case. Apart from this the blasting is done in a controlled manner and the body waves generated due to blasting will loose their velocity in the upper zone of the overburden due to the weathered nature of the material. Thus the distance factor in the present case will not be affecting as the mining method proposed is underground method.</p> <p>After detail deliberations on the application and agenda the Committee noted that the proponent applied for TOR which is recommended for issue of TOR with Public Hearing and following additional TOR conditions.</p> <ol style="list-style-type: none"><li>1.
